Set API

Mathematical set. A collection of distinct keys.

```
public class SET<Key extends Comparable<Key>>
```

SET()	<i>create an empty set</i>
-------	----------------------------

void add(Key key)	<i>add the key to the set</i>
-------------------	-------------------------------

boolean contains(Key key)	<i>is the key in the set?</i>
---------------------------	-------------------------------

void remove(Key key)	<i>remove the key from the set</i>
----------------------	------------------------------------

int size()	<i>number of keys in the set</i>
------------	----------------------------------

Iterator<Key> iterator()	<i>all keys in the set</i>
--------------------------	----------------------------

Q. How to implement efficiently?

Exception filter

- Read in a list of words from one file.
- Print out all words from standard input that are { in, not in } the list.

application	purpose	key	in list
spell checker	identify misspelled words	word	dictionary words
browser	mark visited pages	URL	visited pages
parental controls	block sites	URL	bad sites
chess	detect draw	board	positions
spam filter	eliminate spam	IP address	spam addresses
credit cards	check for stolen cards	number	stolen cards

Exception filter: Java implementation

- Read in a list of words from one file.
- Print out all words from standard input that are **not** in the list.

```
public class BlackList
{
    public static void main(String[] args)
    {
```

```
        SET<String> set = new SET<String>();
```

← create empty set of strings

```
        In in = new In(args[0]);
        while (!in.isEmpty())
            set.add(in.readString());
```

← read in whitelist

```
        while (!StdIn.isEmpty())
        {
            String word = StdIn.readString();
            if (!set.contains(word))
                StdOut.println(word);
        }
```

← print words not in list

```
    }
}
```

Dictionary lookup: Java implementation

```
public class LookupCSV  
{
```

```
    public static void main(String[] args)  
    {
```

```
        In in = new In(args[0]);  
        int keyField = Integer.parseInt(args[1]);  
        int valField = Integer.parseInt(args[2]);
```

← process input file

```
        ST<String, String> st = new ST<String, String>();  
        while (!in.isEmpty())  
        {  
            String line = in.readLine();  
            String[] tokens = line.split(",");  
            String key = tokens[keyField];  
            String val = tokens[valField];  
            st.put(key, val);  
        }
```

← build symbol table

```
        while (!StdIn.isEmpty())  
        {  
            String s = StdIn.readString();  
            if (!st.contains(s)) StdOut.println("Not found");  
            else  
                StdOut.println(st.get(s));  
        }
```

← process lookups
with standard I/O

```
    }  
}
```

3.5 SYMBOL TABLE APPLICATIONS

- ▶ *sets*
- ▶ *dictionary clients*
- ▶ *indexing clients*
- ▶ *sparse vectors*

File indexing

Goal. Index a PC (or the web).

File indexing

Goal. Given a list of text files, create an index so that you can efficiently find all files containing a given query string.

```
% ls *.txt
aesop.txt magna.txt moby.txt
sawyer.txt tale.txt

% java FileIndex *.txt

freedom
magna.txt moby.txt tale.txt

whale
moby.txt

lamb
sawyer.txt aesop.txt
```

```
% ls *.java
BlackList.java Concordance.java
DeDup.java FileIndex.java ST.java
SET.java WhiteList.java

% java FileIndex *.java

import
FileIndex.java SET.java ST.java

Comparator
null
```

File indexing

```
import java.io.File;
public class FileIndex
{
    public static void main(String[] args)
    {
        ST<String, SET<File>> st = new ST<String, SET<File>>();

        for (String filename : args) {
            File file = new File(filename);
            In in = new In(file);
            while (!in.isEmpty())
            {
                String key = in.readString();
                if (!st.contains(key))
                    st.put(word, new SET<File>());
                SET<File> set = st.get(key);
                set.add(file);
            }
        }

        while (!StdIn.isEmpty())
        {
            String query = StdIn.readString();
            StdOut.println(st.get(query));
        }
    }
}
```

symbol table

Concordance

Goal. Preprocess a text corpus to support concordance queries:
given a word, find all occurrences with their immediate contexts.

```
% java Concordance tale.txt
cities
tongues of the two *cities* that were blended in

majesty
their turnkeys and the *majesty* of the law fired
me treason against the *majesty* of the people in
  of his most gracious *majesty* king george the third

princeton
no matches
```

Solution. Key = query string; value = set of indices containing that string.

Concordance

```
public class Concordance
{
    public static void main(String[] args)
    {
        In in = new In(args[0]);
        String[] words = in.readAllStrings();
        ST<String, SET<Integer>> st = new ST<String, SET<Integer>>();
        for (int i = 0; i < words.length; i++)
        {
            String s = words[i];
            if (!st.contains(s))
                st.put(s, new SET<Integer>());
            SET<Integer> set = st.get(s);
            set.add(i);
        }

        while (!StdIn.isEmpty())
        {
            String query = StdIn.readString();
            SET<Integer> set = st.get(query);
            for (int k : set)
                // print words[k-4] to words[k+4]
        }
    }
}
```

← read text and
build index

← process queries
and print
concordances

3.5 SYMBOL TABLE APPLICATIONS

- ▶ *sets*
- ▶ *dictionary clients*
- ▶ *indexing clients*
- ▶ *sparse vectors*

Matrix-vector multiplication (standard implementation)

$$\begin{array}{c} \text{a}[\text{ }][\text{ }] \\ \left[\begin{array}{ccccc} 0 & .90 & 0 & 0 & 0 \\ 0 & 0 & .36 & .36 & .18 \\ 0 & 0 & 0 & .90 & 0 \\ .90 & 0 & 0 & 0 & 0 \\ .47 & 0 & .47 & 0 & 0 \end{array} \right] \end{array} \begin{array}{c} \text{x}[\text{ }] \\ \left[\begin{array}{c} .05 \\ .04 \\ .36 \\ .37 \\ .19 \end{array} \right] \end{array} = \begin{array}{c} \text{b}[\text{ }] \\ \left[\begin{array}{c} .036 \\ .297 \\ .333 \\ .045 \\ .1927 \end{array} \right] \end{array}$$

```
...
double[][] a = new double[N][N];
double[] x = new double[N];
double[] b = new double[N];
...
// initialize a[][] and x[]
...
for (int i = 0; i < N; i++)
{
    sum = 0.0;
    for (int j = 0; j < N; j++)
        sum += a[i][j]*x[j];
    b[i] = sum;
}
```

nested loops
(N² running time)

Sparse matrix-vector multiplication

Problem. Sparse matrix-vector multiplication.

Assumptions. Matrix dimension is 10,000; average nonzeros per row ~ 10 .

Vector representations

1d array (standard) representation.

- Constant time access to elements.
- Space proportional to N .

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0	.36	0	0	0	.36	0	0	0	0	0	0	0	0	.18	0	0	0	0	0

Symbol table representation.

- Key = index, value = entry.
- Efficient iterator.
- Space proportional to number of nonzeros.

Sparse vector data type

```
public class SparseVector  
{
```

```
    private HashST<Integer, Double> v;
```

← HashST because order not important

```
    public SparseVector()  
    { v = new HashST<Integer, Double>(); }  
}
```

← empty ST represents all 0s vector

```
    public void put(int i, double x)  
    { v.put(i, x); }
```

← $a[i] = \text{value}$

```
    public double get(int i)  
    {  
        if (!v.contains(i)) return 0.0;  
        else return v.get(i);  
    }
```

← return $a[i]$

```
    public Iterable<Integer> indices()  
    { return v.keys(); }
```

← iterate through indices of
nonzero entries

```
    public double dot(double[] that)  
    {  
        double sum = 0.0;  
        for (int i : indices())  
            sum += that[i]*this.get(i);  
        return sum;  
    }
```

← dot product is constant
time for sparse vectors

```
}
```

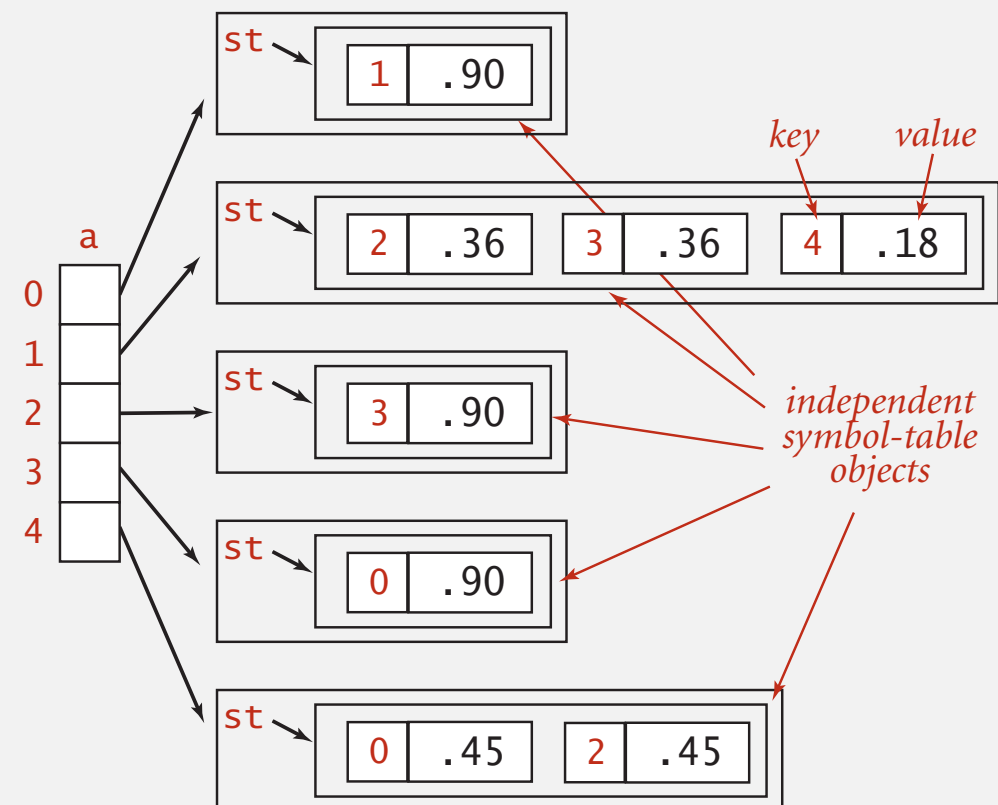

Matrix representations

2D array (standard) matrix representation: Each row of matrix is an **array**.

- Constant time access to elements.
- Space proportional to N^2 .

Sparse matrix representation: Each row of matrix is a **sparse vector**.

- Efficient access to elements.
- Space proportional to number of nonzeros (plus N).

Sparse matrix-vector multiplication

$$\begin{array}{c} \text{a}[\text{ }][\text{ }] \\ \left[\begin{array}{ccccc} 0 & .90 & 0 & 0 & 0 \\ 0 & 0 & .36 & .36 & .18 \\ 0 & 0 & 0 & .90 & 0 \\ .90 & 0 & 0 & 0 & 0 \\ .47 & 0 & .47 & 0 & 0 \end{array} \right] \end{array} \begin{array}{c} \text{x}[\text{ }] \\ \left[\begin{array}{c} .05 \\ .04 \\ .36 \\ .37 \\ .19 \end{array} \right] \end{array} = \begin{array}{c} \text{b}[\text{ }] \\ \left[\begin{array}{c} .036 \\ .297 \\ .333 \\ .045 \\ .1927 \end{array} \right] \end{array}$$

```
..  
SparseVector[] a = new SparseVector[N];  
double[] x = new double[N];  
double[] b = new double[N];  
..  
// Initialize a[] and x[]  
..  
for (int i = 0; i < N; i++)  
    b[i] = a[i].dot(x);
```
